I) CATALOG CONNECTION DEVICE AND METHOD AND RECORDING MEDIUM RECORDING CATALOG CONNECTION PROGRAM

I) Abstract:

PROBLEM TO BE SOLVED: To eliminate the need of answering to overlapping category selection and questions, to improve the efficiency of a procedure and to smooth it by transferring a menu item of a catalog device a poststage to the catalog device in a preceding stage and presenting it one menu item of one catalog device.

SOLUTION: A connection control means 17 of an S catalog device in a ststage adds a menu item name transferred from an N catalog device in preceding stage, a context ID and a filter ID to a context management table of a context management table storage means 23. When a specified menu item on the N catalog device is selected, a retrieval request is issued to the S catalog device. The scenario of the S catalog device activates a context filter 25 designated by the filter ID for a designated menu item name and sends a suited menu item to the N catalog device. In the N catalog device, the returned menu item name is shaped coincidently with own layout and presented to a user.

## AIMS

aim(s)]

aim 1] The service guide apparatus equipped with the catalog equipment for showing a service item and making a choice is connected to two or more cascades. It is the catalog coupling device which performs service guidance (navigation) to the user who accessed the catalog equipment of this service guide apparatus. Omit the menu item which catalog equipment of the latter part which exhibited the menu item to the menu item of the catalog equipment of the preceding paragraph accessed previously by the user overlaps, and the menu item of both catalog equipment is combined. While giving and forming Filter ID in latter catalog equipment so that the menu item of latter catalog equipment may be taken over to the catalog equipment of the preceding paragraph that it should show like one menu item of one catalog equipment A context filter means to return Filter ID to the catalog equipment of the preceding paragraph, A context initialization means to initialize the context for operating said context filter means by making said exhibited menu item, Context ID, Filter ID, and filter conditions into a parameter, When a specific menu item is chosen in selection of the menu item in the catalog equipment of the preceding paragraph, A retrieval demand means to perform retrieval demand while specifying the parameter which contains Context ID and a menu item to latter catalog equipment, If latter catalog equipment receives said retrieval demand, a context management table will be searched for said parameter to a key. A filter ID detection means to detect the filter ID of a context filter means which should be detected, A starting means to start the context filter means specified with said detected filter ID in latter catalog equipment, A return means for this started context filter means to search the range of a menu item specified by the menu item using the retrieval conditions registered beforehand, and to return the suiting menu item to the catalog equipment of the preceding paragraph, The catalog equipment of the preceding paragraph is a catalog coupling device characterized by having a presentation means to operate orthopedically according to a self layout and to show a user said returned menu item.

aim 2] The service guide apparatus equipped with the catalog equipment for showing a service item and making a choice is connected to two or more cascades. It is the catalog connection approach of performing service guidance to the user who accessed the catalog equipment of this service guide apparatus. Omit the menu item which the catalog equipment of the latter part which exhibited the menu item to the menu item of the catalog equipment of the preceding paragraph accessed previously by the user overlaps, and the menu item of both catalog equipment is combined. While giving and forming the context filter means for taking over the menu item of latter catalog equipment to the catalog equipment of the preceding paragraph that it should show like one menu item of one catalog equipment in latter catalog equipment Filter ID is returned to the catalog equipment of the preceding paragraph. Said exhibited menu item, a context for operating said context filter means by making Context ID, Filter ID, and filter conditions into a parameter is initialized. When a specific menu item is chosen in selection of the menu item in the catalog equipment of the preceding paragraph, If a retrieval demand is performed and latter catalog equipment receives said retrieval demand, specifying the parameter which contains Context ID and a menu item to latter catalog equipment Search a context management table for said parameter at a key, and the filter ID of a context filter means which should be started is detected. The context filter means specified with said detected filter ID in latter catalog equipment is started. This started context filter means searches the range of a menu item specified by the menu item using the retrieval conditions registered beforehand. It is the catalog connection approach which returns the suiting menu item to the catalog equipment of the preceding paragraph, and is characterized by for the catalog equipment of the preceding paragraph operating orthopedically according to a self layout, and showing a user said returned menu item.

aim 3] The service guide apparatus equipped with the catalog equipment for showing a service item and making a choice is connected to two or more cascades. It is the record medium which recorded the catalog connection program which performs service guidance to the user who accessed the catalog equipment of this service guide apparatus. Omit the menu item which the catalog equipment of the latter part which exhibited the menu item to the

nu item of the catalog equipment of the preceding paragraph accessed previously by the user overlaps, and the menu n.of both catalog equipment is combined. While giving Filter ID and forming the context filter means for taking over menu item of latter catalog equipment to the catalog equipment of the preceding paragraph that it should show like : menu item of one catalog equipment in latter catalog equipment Filter ID is returned to the catalog equipment of the ceding paragraph. Said exhibited menu item, The context for operating said context filter means by making Context Filter ID, and filter conditions into a parameter is initialized. When a specific menu item is chosen in selection of the nu item in the catalog equipment of the preceding paragraph, If a retrieval demand is performed and latter catalog equipment receives said retrieval demand, specifying the parameter which contains Context ID and a menu item to latter alog equipment Search a context management table for said parameter at a key, and the filter ID of a context filter ans which should be started is detected. The context filter means specified with said detected filter ID in latter alog equipment is started. This started context filter means searches the range of a menu item specified by the menu n using the retrieval conditions registered beforehand. It is the record medium which returned the suiting menu item he catalog equipment of the preceding paragraph, and recorded the catalog connection program characterized by for catalog equipment of the preceding paragraph operating orthopedically according to a self layout, and showing a r said returned menu item.

anslation done.]

## NOTICES \*

Japan Patent Office is not responsible for any damages caused by the use of this translation.

This document has been translated by computer. So the translation may not reflect the original precisely.

\*\*\* shows the word which can not be translated.

In the drawings, any words are not translated.

## TAILED DESCRIPTION

## Detailed Description of the Invention]

[01] Field of the Invention] This invention relates to the catalog coupling device and approach of performing service selection processing (navigation) in a video on demand (VOD), on-line shopping, etc. Furthermore, the service guide apparatus equipped with the catalog equipment for showing a service item and making a user choose in detail is connected to two or more cascades. Omit the menu item which latter catalog equipment overlaps to the menu item of the catalog equipment of the preceding paragraph accessed previously by the user, and the menu item of both catalog equipment is combined. Show like one menu item of one catalog equipment, a user is made to choose a desired service item, and it is related with the record medium which recorded the catalog coupling device and approach of performing service guidance (navigation), and the catalog connection program.

[02] Description of the Prior Art] As the system configuration of this kind of catalog coupling device is shown in drawing 1, it has two or more service guide apparatus 1 and 3 connected to the cascade, and the user terminal 5 is connected to the service guide apparatus 1 and 3 through the communication line. Moreover, the service guide apparatus 1 is formed in service guidance contractor System 7, and the service guide apparatus 3 is formed in service provision equipment 9.

[03] The service guide apparatus 1 and 3 show a user terminal 5 a service item, respectively, and have two or more catalog equipments which have the function to start the item chosen by a user's selection. In addition, the catalog equipment with which the service guide apparatus 1 is equipped will be called N catalog equipment, and the catalog equipment with which the service guide apparatus 3 is equipped will be called S catalog equipment. N catalog equipment is catalog equipment for making a user choose a service provision contractor and its service item, and S catalog equipment is catalog equipment for making the detail of the service item which a service provision contractor chooses.

[04] Next, the operation of a catalog coupling device by which a system configuration is carried out in this way is explained with reference to the example of the hierarchical menu item of the tree structure of N catalog equipment shown in drawing 2, and S catalog equipment. In addition, drawing 2 shows the example of shopping catalog equipment.

[05] A user accesses the service guide apparatus 1 from a user terminal 5, chooses N catalog equipment formed in this service guide apparatus 1, and chooses A company and the service item which are a service provision contractor according to a selection sequence which is called "personal computer" -> "desktop" ->"tower" -> "A company" from N catalog equipment which has the hierarchical menu of the tree structure as shown in the first half of drawing 2 (step S1).

[06] N catalog equipment of the service guide apparatus 1 starts S catalog equipment through the service guide apparatus 3 equipped with S catalog equipment of A company which is a service provision contractor, after selection of a service provision contractor by the user and a service item is completed (step S2).

[07] S catalog equipment of the service guide apparatus 3 has the hierarchical menu of the tree structure as shown in the second half of drawing 2, and menu selection is performed like -> "desktop" "classified by model" ->"tower" -> "product 1" so that it may be shown in the second half of drawing 2, so that a user may perform desired service and selection of service provision conditions from this S catalog equipment through a user terminal 5, and "the product 1" which is a desired service item is chosen (step S3). After selection of the service item by the user is completed, S catalog equipment of the service guide apparatus 3 starts service provision equipment 9, and a user is provided with service (step S4).

08] In addition, in the conventional processing mentioned above, although dialogue control with a user moves to the service guide apparatus 3 from the service guide apparatus 1 when S catalog equipment is started from N catalog equipment, in this case, a user recognizes the difference between the scenario on N catalog equipment, and it on S catalog equipment, and the menu item of a new scenario is rechosen.

09]

[Problem(s) to be Solved by the Invention] The inside of the selection which the user performed on N catalog equipment is conventional technique mentioned above from the difference in the scenario of selection of the service item in N catalog equipment and S catalog equipment. Since the service item of S catalog equipment and the selections without direct relation are not taken over to S catalog equipment, when they are seen from a user, they must overlap and reply to category and a question of the same kind with both catalog equipment, and have the problem of being it being troublesome and inefficient-like.

10] As mentioned above, the user specifically specifies the attribute of the "desktop" as a category of a desired personal computer, a "tower", etc., etc. on N catalog equipment, but since this information is not taken over to the service guide apparatus 3 and S catalog equipment, there is a problem that it must choose again.

11] This invention was made in view of the above, the place made into the purpose omits the menu item which overlaps so that a user may not reply to the duplicate category or the duplicate question, catalog equipment combines, it shows like one menu item of one catalog equipment, and is in offering the record medium which recorded the catalog coupling device and the approach of having attained increase in efficiency and carrying out smoothly of procedure, and the catalog connection program.

12]

[Means for Solving the Problem] In order to attain the above-mentioned purpose, this invention according to claim 1 is service guide apparatus equipped with the catalog equipment for showing a service item and making a user choose connected to two or more cascades. It is the catalog coupling device which performs service guidance (navigation) to user who accessed the catalog equipment of this service guide apparatus. Omit the menu item which the catalog equipment of the latter part which exhibited the menu item to the menu item of the catalog equipment of the preceding paragraph accessed previously by the user overlaps, and the menu item of both catalog equipment is combined. While taking and forming Filter ID in latter catalog equipment so that the menu item of latter catalog equipment may be taken over to the catalog equipment of the preceding paragraph that it should show like one menu item of one catalog equipment. A context filter means to return Filter ID to the catalog equipment of the preceding paragraph, A context initialization means to initialize the context for operating said context filter means by making said exhibited menu item, Context ID, Filter ID, and filter conditions into a parameter, When a specific menu item is chosen in selection of the menu item in the catalog equipment of the preceding paragraph, A retrieval demand means to perform a retrieval demand while specifying the parameter which contains Context ID and a menu item to latter catalog equipment, If latter catalog equipment receives said retrieval demand, a context management table will be searched for said parameter to a. A filter ID detection means to detect the filter ID of a context filter means which should be started, A starting means to start the context filter means specified with said detected filter ID in latter catalog equipment, A return means this started context filter means to search the range of a menu item specified by the menu item using the retrieval conditions registered beforehand, and to return the suiting menu item to the catalog equipment of the preceding paragraph, The catalog equipment of the preceding paragraph makes it a summary to have a presentation means to generate orthopedically according to a self layout and to show a user said returned menu item.

13] If it is in this invention according to claim 1, omit the menu item which latter catalog equipment overlaps to the menu item of the catalog equipment of the preceding paragraph, and the menu item of both catalog equipment is combined. The context filter means for taking over the menu item of latter catalog equipment to the catalog equipment the preceding paragraph is formed in latter catalog equipment. The context for operating a context filter means by taking a menu item, Context ID, Filter ID, and filter conditions into a parameter is initialized. Perform a retrieval demand, specifying the parameter which contains Context ID and a menu item to latter catalog equipment, and latter catalog equipment searches a context management table. Detect the filter ID of a context filter means which should be started, and the context filter means specified with this filter ID is started. In order for a context filter means to search the range of a menu item, to return the suiting menu item to the catalog equipment of the preceding paragraph, and for the catalog equipment of the preceding paragraph to double the layout of the returned menu item and to show a user, A user can seem to have chosen the service item with one catalog equipment, needs to reply to neither duplication question nor a question, and can perform smooth navigation.

14] Moreover, the service guide apparatus equipped with the catalog equipment for this invention according to claim 1 is presenting a service item, and making a user choose it is connected to two or more cascades. It is the catalog

injection approach of performing service guidance to the user who accessed the catalog equipment of this service de apparatus. Omit the menu item which the catalog equipment of the latter part which exhibited the menu item to menu item of the catalog equipment of the preceding paragraph accessed previously by the user overlaps, and the menu item of both catalog equipment is combined. While giving Filter ID and forming the context filter means for taking over the menu item of latter catalog equipment to the catalog equipment of the preceding paragraph that it should show like one menu item of one catalog equipment in latter catalog equipment Filter ID is returned to the catalog equipment of the preceding paragraph. Said exhibited menu item, The context for operating said context filter means by making Context ID, Filter ID, and filter conditions into a parameter is initialized. When a specific menu item is chosen selection of the menu item in the catalog equipment of the preceding paragraph, If a retrieval demand is performed in latter catalog equipment receives said retrieval demand, specifying the parameter which contains Context ID and a menu item to latter catalog equipment Search a context management table for said parameter at a key, and the filter ID a context filter means which should be started is detected. The context filter means specified with said detected filter in latter catalog equipment is started. This started context filter means searches the range of a menu item specified by menu item using the retrieval conditions registered beforehand. Returning the suiting menu item to the catalog equipment of the preceding paragraph, the catalog equipment of the preceding paragraph makes it a summary to operate orthopedically according to a self layout and to show a user said returned menu item.

15] If it is in this invention according to claim 2, omit the menu item which latter catalog equipment overlaps to the menu item of the catalog equipment of the preceding paragraph, and the menu item of both catalog equipment is combined. The context filter means for taking over the menu item of latter catalog equipment to the catalog equipment of the preceding paragraph is formed in latter catalog equipment. The context for operating a context filter means by making a menu item, Context ID, Filter ID, and filter conditions into a parameter is initialized. Perform a retrieval demand, specifying the parameter which contains Context ID and a menu item to latter catalog equipment, and latter catalog equipment searches a context management table. Detect the filter ID of a context filter means which should be started, and the context filter means specified with this filter ID is started. In order for a context filter means to search the range of a menu item, to return the suiting menu item to the catalog equipment of the preceding paragraph, and for the catalog equipment of the preceding paragraph to double the layout of the returned menu item and to show a user, A user can seem to have chosen the service item with one catalog equipment, needs to reply to neither duplication question nor a question, and can perform smooth navigation.

16] Furthermore, the service guide apparatus equipped with the catalog equipment for this invention according to claim 3 presenting a service item, and making a user choose it is connected to two or more cascades. It is the record medium which recorded the catalog connection program which performs service guidance to the user who accessed the catalog equipment of this service guide apparatus. Omit the menu item which the catalog equipment of the latter part which exhibited the menu item to the menu item of the catalog equipment of the preceding paragraph accessed previously by the user overlaps, and the menu item of both catalog equipment is combined. While giving Filter ID and forming the context filter means for taking over the menu item of latter catalog equipment to the catalog equipment of the preceding paragraph that it should show like one menu item of one catalog equipment in latter catalog equipment Filter ID is returned to the catalog equipment of the preceding paragraph. Said exhibited menu item, The context for operating said context filter means by making Context ID, Filter ID, and filter conditions into a parameter is initialized. When a specific menu item is chosen in selection of the menu item in the catalog equipment of the preceding paragraph, a retrieval demand is performed and latter catalog equipment receives said retrieval demand, specifying the parameter which contains Context ID and a menu item to latter catalog equipment Search a context management table for said parameter at a key, and the filter ID of a context filter means which should be started is detected. The context filter means specified with said detected filter ID in latter catalog equipment is started. This started context filter means searches the range of a menu item specified by the menu item using the retrieval conditions registered beforehand. The suiting menu item is returned to the catalog equipment of the preceding paragraph, and let it be a summary for the catalog equipment of the preceding paragraph to record the catalog connection program which operates orthopedically according to a self layout and shows a user said returned menu item on a record medium.

17] If it is in this invention according to claim 3, omit the menu item which latter catalog equipment overlaps to the menu item of the catalog equipment of the preceding paragraph, and the menu item of both catalog equipment is combined. The context filter means for taking over the menu item of latter catalog equipment to the catalog equipment of the preceding paragraph is formed in latter catalog equipment. The context for operating a context filter means by making a menu item, Context ID, Filter ID, and filter conditions into a parameter is initialized. Perform a retrieval demand, specifying the parameter which contains Context ID and a menu item to latter catalog equipment, and latter catalog equipment searches a context management table. Detect the filter ID of a context filter means which should be

ted, and the context filter means specified with this filter ID is started. A context filter means searches the range of a menu item, and the suiting menu item is returned to the catalog equipment of the preceding paragraph. Since the catalog equipment of the preceding paragraph is recording the catalog connection program which doubles the layout of the menu item and is shown to a user on the record medium, it can raise the distributivity using this record medium.

18]

[embodiment of the Invention] Hereafter, the gestalt of operation of this invention is explained using a drawing. Drawing 3 is drawing showing the configuration of the catalog equipment formed in the service guide apparatus used by the catalog coupling device concerning 1 operation gestalt of this invention. The catalog equipment shown in this drawing is formed in the service guide apparatus 1 and 3 in the system configuration of the catalog coupling device shown in drawing 1, and the system configuration of the catalog coupling device shown in drawing 1 can be applied to catalog coupling device of this operation gestalt except for the catalog equipment shown in the service guide apparatus 1 and 3 at drawing 3 being used. Moreover, the catalog equipment formed in the service guide apparatus 1 is N catalog equipment, the catalog equipment formed in the service guide apparatus 3 is called S catalog equipment, N catalog equipment is catalog equipment for making a user choose a service provision contractor and its service item, and S catalog equipment is catalog equipment for making the detail of the service item which a service provision contractor offers choose.

19] The catalog equipment shown in drawing 3 has a context management table storing means 23 to store the context management table which consists of a menu storing means 15 by which the list of the dialogue control means 11, the scenario storing means 13, and menu items etc. was stored, the connection control means 17, a menu item, a context ID, Filter ID, etc., and the context filter 25.

20] Moreover, the function incorporating the context filter 25 which manages menu item retrieval processing of drawing met the scenario of the N catalog equipment which is catalog equipment of the preceding paragraph gave the scenario on the S catalog equipment which is latter catalog equipment, and S catalog equipment has built into some N catalog equipments in the catalog equipment shown in drawing 3 by establishing the context management table which manages the location which operates the context filter 25 in the connection control means 17 on S catalog equipment.

21] Next, an operation is explained with reference to the flow chart shown in drawing 4. In drawing 4, S catalog equipment opens first the list of menu item names which can register the context filter 25 to N catalog equipment [processing \*\*]. N catalog equipment publishes the inclusion demand of the context filter 25 to the connection control means 17 of S catalog equipment [processing \*\*]. The positional information of a context filter stereo or a context filter stereo is succeeded as a parameter of this demand, the context filter 25 is acquired from the location specified with the parameter or the parameter, and Filter ID is given and memorized. In addition, Filter ID is returned to N catalog equipment in order to show what was memorized correctly.

22] N catalog equipment publishes a context initialization demand to the connection control means 17 of S catalog equipment [processing \*\*]. Four parameters are specified as this demand. The 1st parameter is the menu item name omitted by processing \*\*, the 2nd parameter is the context ID used as key information at the time of N catalog equipment starting the context filter 25, the 3rd parameter is the filter ID registered by processing \*\*, and the 4th parameter is the filter conditions for controlling actuation of the context filter 25. In addition, when filter conditions can be omitted and it is not specified, the default of context filter 25 self is used.

23] Moreover, the connection control means 17 of S catalog equipment adds a menu item name, Context ID, and other parameters of Filter ID to the context management table of the context management table storing means 23 among succeeded parameters, and sets retrieval conditions as the context filter 25. N catalog equipment matches and memorizes its menu item and Context ID of a scenario.

24] Next, a user starts N catalog equipment and chooses the menu item in accordance with [processing \*\*] and the own scenario [processing \*\*, \*\*]. And the scenario of N catalog equipment advances a retrieval demand to S catalog equipment ignited by the specific menu item on N catalog equipment having been chosen [processing \*\*]. Two parameters are specified as this demand. The 1st parameter is Context ID and the 2nd parameter is a menu item name. In case, a menu item name is ommissible.

25] If S catalog equipment receives said retrieval demand, the context management table of the context management table storing means 23 will be searched for the specified parameter at a key, and the filter ID of the context filter 25 which should be started will be detected. Here, when the menu item name is omitted, the group of Context ID, all responding menu items, and context filters is found. The scenario of S catalog equipment starts the context filter 25 specified with Filter ID to the specified menu item name. The context filter 25 searches the range of a menu specified by menu item using the retrieval conditions registered beforehand, and sends the suiting menu item to N catalog equipment.

ipment [processing \*\*].

26] And with N catalog equipment, according to an own layout, it operates orthopedically, and the menu item name turned from the context filter 25 is shown to a user [processing \*\*].

27] Next, with reference to drawing 5 and drawing 2 , an operation is explained still more concretely. In addition, in explanation, the premises 1-4 shown below are established. A premise 1 shall associate the menu item on N catalog equipment "A company" the "model exception" of A company in drawing 2 . The premise 2 shall exhibit the "model exception" as a menu item name which S catalog equipment of A company can filter register (processing \*\* of drawing 2). As for the premise 3, the context filter 25 to retrieval condition Q1: "the menu item to the product whose duct type is a "desktop" and whose configuration is a "tower"" is prepared for N catalog equipment. This context er 25 is mounted as software which can operate on the service guide apparatus 3. The procedure of processing [ of wing 4 ] \*\* and \*\* of a premise 4 is executed. Filter ID=F1 should be returned from S catalog equipment as a result having registered the context filter 25 of a premise 3.

28] An operation is explained under the above prerequisite. First, in processing [ of drawing 5 ] \*\*, a context is alized by assignment parameter value and the context management table of the context management table storing ans 23 will be in the condition of Table 1 shown below. The retrieval conditions Q1 are passed to F1 already istered.

[29]

[Table 1]

メニュー項目	コンテキストID	フィルタID
「機種別」	C1	F1

xt, in processing \*\*-\*\*, a user starts N catalog equipment, receives offer of a scenario from N catalog equipment, and oses a menu like "personal computer" -> "desktop" ->"tower" -> "A company" by the menu item on N catalog uipment. Since the menu item "A company" is related with S catalog equipment of A company from the premise 1, a etrieval demand is performed [processing \*\*]. S catalog equipment which received the retrieval demand understands t 25 is the context filterF1 which should be started from the context management table in the condition of Table 1 ntioned above, and starts F1.

30] The menu item which F1 makes the retrieval range subtree below [ "classified by model" ] the menu item of Salog equipment, and suits the retrieval conditions Q1 is looked for, and it notifies to a scenario that "a product 1" and product 2" correspond. The scenario of N catalog equipment returns this result to N catalog equipment [processing ].

31] With N catalog equipment, it edits so that a retrieval result can be displayed with an original layout, and a user is own [processing \*\*]. A user continues selection based on this information.

32] Effect of the Invention] As explained above, according to this invention, omit the menu item which latter catalog equipment overlaps to the menu item of the catalog equipment of the preceding paragraph, and the menu item of both catalog equipment is combined. The menu item of latter catalog equipment is taken over to the catalog equipment of the ceding paragraph. Since it shows like one menu item of one catalog equipment, a user seems to have chosen the vice item with one catalog equipment. It is not necessary to reply to the duplicate category selection and the duplicate estion, smooth navigation can be performed, and increase in efficiency and carrying out smoothly of procedure can be ained.
